

WHAT'S CHANGING: RESOURCE PLANNER

What do I need to know?

Resource Planner: The Planon Resource Planner is a graphical planning tool. It gives access to one or multiple specially configured planboards, on which Heads can assign work to available resources quickly and easily. The orders and work assignments displayed in Resource Planner are registered in the Work Orders TSI (task specific interface) and include the following order types:

- Reactive work orders
- Planned (preventative) maintenance work orders

What do the changes mean?

Today...	With Planon
Each division manually schedules work (paper, calendar, spreadsheet, verbal)	➤ Use graphical, drag/drop calendar functionality to schedule staff and assign Work Orders
Use of Standing Work Orders for majority of maintenance work	➤ No standing work orders ➤ Work order(s) are generated for every Service Request; Work orders are planned, scheduled and assigned to technicians

Today...	With Planon
Lack of resource availability within each shop and across shops	➤ Complete visibility of all resources across shops with absences from Workday
Heads communicate with one another for Work Orders requiring multiple shops to complete in a sequential order	➤ Facilitates scheduling and sequencing of work assignments
Heads check technician certifications from a spreadsheet	➤ Certification technician check prior to work assignments (Stream 2)
